Weekly Project Progress Report

MedLink Team

Our team is a cohesive and well-integrated unit, combining diverse skills and perspectives to achieve a common goal. Each member contributes unique strengths, which enables effective collaboration and ensures that all aspects of the project are developed with high quality and consistency.

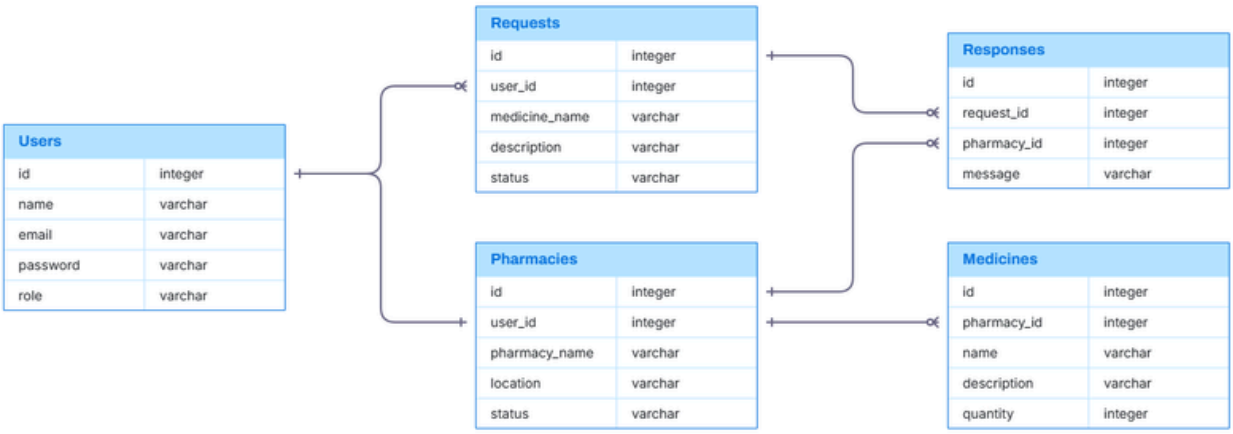
Use Case Diagram

The Use Case Diagram illustrates the main functionalities of the MedLink system and the interactions between different types of users: Admin, Citizen, and Pharmacy.

Work completed this week

Database Schema (ERD)



The ERD shows the structure of the MedLink database and the relationships between its main entities.
The Users table stores all users (citizens, pharmacies, and admins). Each pharmacy is linked to a user through the **Pharmacies** table.
The **Medicines** table contains medicines added by pharmacies, while the **Requests** table stores user requests for unavailable medicines.
The **Responses** table represents replies from pharmacies to these requests.
These relationships help organize the data and support system operations such as searching for medicines and managing requests.

Work completed this week

Tech Stack

The MedLink system is being developed using a modern web development stack.
The frontend is currently implemented using HTML, CSS, and JavaScript to build a responsive and user-friendly interface.
The backend will be developed using PHP with the Laravel framework, which will handle the system logic, authentication, and data processing.
The database will use MySQL to store data such as users, pharmacies, medicines, and requests.
This stack provides a solid foundation for building a scalable and efficient web application.

Features implemented

We have developed the User Interface (UI/UX) of the website, which represents the tangible aspect of the system for users. Currently, the website includes three main front-end components:

1. Landing Page – the main entry page for users.
2. Registration and Login Page – allowing users to create accounts and log in.
3. Citizen Dashboard – the main dashboard for citizens to search and request medications.

Additionally, the website structure has been prepared to include Pharmacies and Admin Dashboard, but these components have not been implemented yet.

Problems encountered

- No major technical issues were faced; however, there was a challenge in distributing frontend development tasks among team members to ensure efficiency and avoid overlapping work.

Solutions applied

- Tasks were distributed as follows:
  - Alaa' developed the Landing Page, Login and Registration pages, and all components related to the Citizen Dashboard.
  - Hurih developed all components related to the Admin Dashboard and Pharmacy management.
  - Team members maintained continuous communication with Sara (UI/UX designer) to ensure that the frontend implementation matched the UX designs perfectly, resulting in a polished and consistent interface.

Plan for next week

Next week, the team will focus on designing and preparing the UI wireframes and user flow for the main pages of the system. The planned tasks are:

Design wireframes for main pages: Login, Dashboards (Citizen & Admin), Add/Edit Item.
Prepare a user flow diagram showing navigation between pages.
Ensure wireframes match current frontend and UX design.
Compile all designs and code updates into a PDF and update the GitHub repository.

Questions for Instructor

Are there any specific requirements or templates we should follow for the wireframes and user flow diagrams?

Should we include detailed interactions for all user types in the submission?
